Download su binary 3.1-1 apk

Binary su download. Su binary apk.

2018 supersuroot.org. All Rights Reserved. SuperSU v0.93 latest Flashable Zip update for Superuser v3.1.3 Final. Major update released on July 13, 2012. Changelog - Updated Flashable zips with the Latest SU Binaries. - Fixed a bug with outdated Su Binary in SuperSU not giving root Access. - Updated Superuser app. After flashing the superSU zip, reboot your phone and start the superSU app. It will automatically update the su binary by itself. SuperSU is working correctly as shown in the screenshot. Please download the zip files again from the attachment. Instructions: 1. Download zip file 2. Put it in sd card 3. Boot into CWM. Recovery 4. Select install Zip File from sd card 5. Toggle Script Assets = ENABLED 6. Select The zip file 7. Reboot ENJOY. Chainfire - SuperSU. App ChainsDD- Superuser. Yes, that works with Superuser app, but not with SuperSU. SuperSU won't give system root access. Sent from my Jelly Belly using XDA I've got the same issue with version 3.1.3. Superuser downloads the updated binary and fails during the check. Anyone else experiencing this problem? I'm trying the workaround from the first post on this page... Hi all, greetings! I still have the same problem with version 3.1.3. Superuser downloads the updated binary but fails during the check. Has anyone got the same issue and any ideas how to fix it? I'll try the workaround in the first post now... Hi all, greetings from DSM! Try clearing Dalvik cache and restarting; let us know if that helps Sent from my Galaxy Nexus using XDA Premium Untick outdated binary notification or you can't update Superuser within itself. Indeed update with Playstore instead. That was only an advice, untick outdated binary notification or you can not update superuser in superuser itself, and indeed update with play store, this was only a advice I keep telling there is a bug in the Superuser app for updating SU binary. Just wait for ChainsDD to fix it. Please cooperate, not my flashable zip bug! I'll provide the latest binary soon. Post updated. Once again, with the latest SU app. Can't flash SuperSU V0.92 -efghi-signed. Stable. Update.zip: a straight error occurred, error on the zip? Read instructions carefully from the first post Working great On the First post Working great [OP] Does this work with Jelly Bean? Sent from my Nexus S using Tapatalk 2 I tried flashing yesterday and it failed. Sent from my Jelly Belly using XDA May Be it doesn't work with jellybean! I'll also give a try on my side, whether it works or not. If it works, I'll update the post. Cheers! I'm slightly confused; got this error stating rooting failed when updating SU binary after rooting my phone running ICS and verifying with a root checking app Just downloaded this app from the store today, everything appears current I did root my phone earlier (ICS) verified with a root checking app However, when trying to update the SU binary, I get an error saying that the rooting failed. Not sure now if my phone is truly rooted Flash zip again via CWM; read instructions carefully on first post SuperSU will prompt outdated binary afterwards just click continue your binary will automatically be updated & you'll gain root access Note: SuperSU was updated to 0.93 Tnx I know about that Not many responses, think I won't update **Updating Thread:** * The thread's responses are very low, implying that no one wants to engage with its content. * From Arcman's side, the THREAD CLOSED; however, if there were many requests for newer versions, he would update the zips & thread. The toggle Script Assets feature on my LT18i using Tapatalk 2 is confusing me, especially since it says "toggle Script Assets = ENABLED". I'm also unsure about uninstalling and reinstalling the Superuser, which might affect my rooted status. Additionally, I encountered a bad file error when trying to install the Superuser, which seemed to be resolved by copying the su.zip from another device. Here's a rewritten version of your text: I got frustrated after wasting time, which led me to write in a way that wasn't pleasant. So, I apologize for my earlier stern tone. On XDA, it's standard practice to keep the first post updated with new info and current status. Let's all follow this common sense approach to avoid creating chaos. Instead of posting short updates late in the thread, we can take the time to read the entire thread, search for similar issues, and ask questions if needed. This will help reduce the noise on XDA. Sent from my device... Ah, I see you think that devs shouldn't be responsible for clear communication and instead rely on users to figure it out. No wonder XDA has a reputation for being chaotic. That's not what I said, though. Before we go off on a tangent about some dev who doesn't owe us anything, let's take the time to read the forum posts. If that seems too overwhelming, maybe you should find something less demanding. aborted?? i have xxsj 4.1.2 on my s2 rooted with philz kernel but supersu is missing and when i tried to flash this installation aborted?? what to do ?? Reactions: myepicyear First, try updating the Superuser binaries inside the app itself. If it fails, you can try flashing the zip file in bootloader mode. Make sure to toggle script assets before flashing. If you're still having issues, you may want to reflash your ROM and start the rooting process again from scratch. I hope this helps! =) Solution for superuser the zip is bad because he zipped the folder "Superuser-3.1.3 [46] -efghi-signed Final" inside the zip To fix this issue, you can extract the folder inside the zip file to your desktop or any other location. Then, select both the META-INF and system folders and add them to the Superuser-3.1.3 [46] - efghi-signed Final archive using WinRar. Finally, flash this modified zip file in CWM or TWRP mode. This should resolve the issue for you. I'm using Tapatalk from my GT-I9082 to post. This is super helpful for my blog! I'm a bit lost, though - should I use the Zip or Rar file to root my Android KitKat 4.4.2 device? Does this method even work on that version?
